

Continuum of Care CareTracker for Rehabilitation

CareTracker for Rehabilitation

Documentation at the point of care

Mobile documentation for inpatient rehabilitation organizations

Accurate documentation is critical to understanding the condition of the patients under your care. With *CareTracker*[®], caregivers like rehab nursing technicians can record required daily documentation quickly and easily using iPads[®] and wall-mounted touch-screen kiosks.

CareTracker features picture icons with yellow highlights that indicate categories the caregivers must complete during the shift. Once completed, the yellow turns gray indicating that the minimum documentation necessary for the shift has been completed.

The simple visual icons and intuitive workflows are designed to help caregivers minimize reading and learning time. This helps even new staff members become ready to start documenting accurately and completely in minutes.

Key benefits

CareTracker is designed to help caregivers:

- Quickly and accurately record required daily documentation with iPads and wall-mounted touchscreens.
- Get a more precise picture of each patient's true condition.
- Identify potential health issues before they become problems.
- Improve communication between caregivers and other facility staff.

"With CareTracker®, we turned medical terminology into layman's terms for our nursing assistants. What a difference it made to do that."

Mary Ellen Griffin

Director of Nursing Informatics
Encompass Health

Improved accuracy, improved outcomes

Challenging workflows, copying, missed entries and misinformation are common issues with many forms of documentation. In addition, accessing and retrieving the recorded information can be difficult.

CareTracker helps organizations quickly record and view accurate documentation for activities of daily living, meal intakes, and more, providing a more complete picture of each patient's true condition.

CareTracker is integrated with the *Cerner Millennium®* EHR platform, which ensures the recorded documentation flows directly into the patient's chart.

Enhancing the quality of care

The *CareTracker* Clinical Intelligence tool analyzes millions of data records collected by caregivers and can help you quickly identify potential issues. Dehydration, skin issues, poor intake and weight loss are just some patient conditions that may not always be reported immediately.

CareTracker can help monitor these types of conditions and alert you to changes before problems arise.

CareTracker can also trend, compare and analyze collected data to help you best understand each patient's care needs.

Broadening facility communications

Effective communication between front-line caregivers and other facility members is critical. *CareTracker* helps staff members view and communicate information regarding facility functions and changes in patient conditions.

Patient-centered programs

Facilities can create and monitor the progress of patient-specific plans for behaviors, toileting programs, turn and reposition programs and anything unique to a specific patient.

Each patient's dashboard can highlight specific areas of concern and a few clicks will provide the information you need to support decisions about updating each patient's care plan.

About Cerner

We're continuously building on our foundation of intelligent solutions for the health care industry. Our technologies connect people and systems, and our wide range of services support the clinical, financial and operational needs of organizations of every size.
